Raffaele Ciriello

Agenda

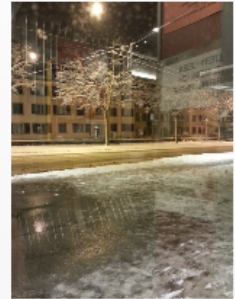

1. Collected Ideas
2. Feedback
3. Personal Experience
4. Possible use cases

Collected Ideas

Mainly functional

Needs partially **based on current circumstances** (location, task,...)

Ideas far away from being understandable, complete, ...

I want an app showing me open stores, pubs etc in the near. But just the open ones!

I'd love to have an app where I could just enter my ingredients I've at home and it would make me suggestions what I could cook with it.

Feedback

Half of the requirements got **rated**

Few got a **comment**, no additional needs just clarification

- Too unspecific requirements
- Too short time
- Unrealistic setting with students

Experience with iRequirePlus & weQuire

Basic functionality exists

iRequirePlus: possible improvements

- Optional picture function
- Fluent transition between need & rational
- Optional location tracking
- Should display all my requests & maybe others too
- Bug: error-message while changing too fast to notification & back while sending

Experience with iRequirePlus & weQuire

weQuire: possible improvements

- Rating function also in detail view
- 250 chars is in reality not much space
- Arrangement of requirements a bit unclear, maybe hide already read ones or mark unread ones with a color
- Bug1: while being in detail view in own requirements -> switches view automatically back to newest requirements
- Bug2: GeoTagging does not work

Possible Use Cases

Extends the circle of stakeholders to a **broad range of end-users**.

Nice for **collecting many ideas**

Eliciting requirements **whenever one comes to your mind**.

But: **Quantity is not Quality** (Stay focused)

Possible Use Cases

Categorization and Maintenance of requirements seems hard at the moment.

Seamless integration into normal worklife needed.

“If kept outside the normal workflow, the tool with eventually wither and die”. (Farmer2006)
